

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) A method of allocating bandwidths in a wireless LAN comprising a plurality of access points each using the same wireless technology for data communication with users and a control unit, the method comprising the steps of:

- a) continuously monitoring bandwidth usage by each of the access points via the control unit; and
- b) re-allocating bandwidth capacity from a low bandwidth usage access point to a high bandwidth usage access point.

2. (Original) A method as claimed in claim 1, wherein the access points each use the 802.11 wireless technology.

3. (Original) A method as claimed in claim 2, wherein the 802.11 wireless technology uses DSSS.

4. (Original) A method as claimed in claim 3, wherein step b) is such as to re-allocate a first sub-bandwidth of DSSS associated with the low bandwidth usage access point to complement a second sub-bandwidth of DSSS associated with the high bandwidth usage access point, and the method further comprises the step of expanding the coverage of a third access point using the third sub-bandwidth of DSSS for data communication with the users of the access point previously operating under the first sub-bandwidth of DSSS.

5. (Original) A method as claimed in claim 2, wherein the 802.11 wireless technology operates under FHSS.

6. (Original) A method as claimed in claim 5, wherein step b) is such as to re-allocate at least one FHSS bandwidth channel from the low bandwidth usage access point to the high bandwidth usage access point.

7. **(Currently Amended)** A wireless LAN comprising a plurality of access points each using the same wireless technology for data communication with users, and a control unit operable to continuously monitor bandwidth usage by each of the access points, and further operable to reallocate bandwidth capacity from a low bandwidth usage access point to a high bandwidth usage access point.

8. **(Original)** A LAN as claimed in claim 7, wherein the access points each use the 802.11 wireless technology.

9. **(Original)** A LAN as claimed in claim 8, wherein the 802.11 wireless technology uses DSSS.

10. **(Previously Presented)** A LAN as claimed in claim 9, wherein the control unit is configured to re-allocate a first sub-bandwidth of DSSS associated with the low bandwidth usage access point to complement a second sub-bandwidth of DSSS associated with the high bandwidth usage access point, and said control unit is further configured to expand the coverage of a third access point using the third sub-bandwidth of DSSS for data communication with the users of the access point previously operating under the first sub-bandwidth of DSSS.

11. **(Original)** A LAN as claimed in claim 8, wherein the 802.11 wireless technology operates under FHSS.

12. **(Previously Presented)** A LAN as claimed in claim 11, wherein the control unit is such as to re-allocate at least one FHSS bandwidth channel from the low bandwidth usage access point to the high bandwidth usage access point.

13. **(Currently Amended)** A method of allocating bandwidths in a wireless LAN comprising a plurality of access points each using the 802.11, DSSS wireless technology for data communication with users and a control unit, the method comprising the steps of:

a) continuously monitoring bandwidth usage by each of the access points via the control unit; and

b) re-allocating bandwidth capacity from a low bandwidth usage access point to a high bandwidth usage access point; wherein

step b) is such as to re-allocate a first sub-bandwidth of DSSS associated with the low bandwidth usage access point to complement a second sub-bandwidth of DSSS associated with the high bandwidth usage access point, and the method further comprises the step of expanding the coverage of a third access point using the third sub-bandwidth of DSSS for data communication with the users of the access point previously operating under the first sub-bandwidth of DSSS.

14. **(Currently Amended)** A method of allocating bandwidths in a wireless LAN having a plurality of access points each using the 802.11, FSSS wireless technology for data communication with users and a control unit, the method comprising the steps of:

a) continuously monitoring bandwidth usage by each of the access points via the control unit; and

b) re-allocating bandwidth capacity from a low bandwidth usage access point to a high bandwidth usage access point; wherein

step b) is such as to re-allocate at least one FHSS bandwidth channel from the low bandwidth usage access point to the high bandwidth usage access point.

15. **(Currently Amended)** A wireless LAN comprising a plurality of access points each using 802.11, DSSS wireless technology for data communication with users, wherein the LAN comprises a control unit operable to continuously monitor bandwidth usage by each of the access points, and to reallocate bandwidth capacity from a low bandwidth usage access point to a high bandwidth usage access point; and wherein the control unit is further operable to re-allocate a first sub-bandwidth of DSSS associated with the low bandwidth usage access point to complement a second sub-bandwidth of DSSS associated with the high bandwidth usage access point, and wherein said control unit is further operable to expand the coverage of a third access point using the third sub-bandwidth of DSSS for data communication with the users of the access point previously operating under the first sub-bandwidth of DSSS.

16. **(Currently Amended)** A wireless LAN constituted by a plurality of access points each using 802.11, FSSS wireless technology for data communication with users, wherein the LAN comprises a control unit operable to continuously monitor bandwidth usage by each of the access points, and for re-allocating bandwidth capacity from a low bandwidth usage access point to a high bandwidth usage access point; and wherein the control unit is further operable to re-allocate at least one FHSS bandwidth channel from the low bandwidth usage access point to the high bandwidth usage access point.
